## Figure Captions (Supplementary Online Material)

Fig. S1. Compilation of Holocene relative sea-level records from the western North Atlantic.

Records are from New Jersey (blue/green symbols from this study and red symbols from N. P. Psuty, *Physical Geography*, 7, 156 (1986), Delaware (46)southern New England (47), and a Caribbean reef compilation (49) with a polynomial fit from 8-0 ka (6) and a linear fit from 5-0 ka (this study).

Fig. S2. Comparison sea-level record from the Huon New Guinea terraces (7) and Barbados (6) and benthic foraminiferal  $\delta^{18}\text{O}$  record from Pacific (Carnegie Ridge) core V19-30 (N. J.

Shackleton, N. G. Pisias, in The Carbon Cycle and Atmospheric CO<sub>2</sub>, E. T. Sunquist, W. S. Broecker, Eds. (American Geophysical Union, Washington, D.C., 1985), pp. 303-317.). Grey curve at bottom shows variations in insolation for June at 65°N latitude. 0 is modern sea level.

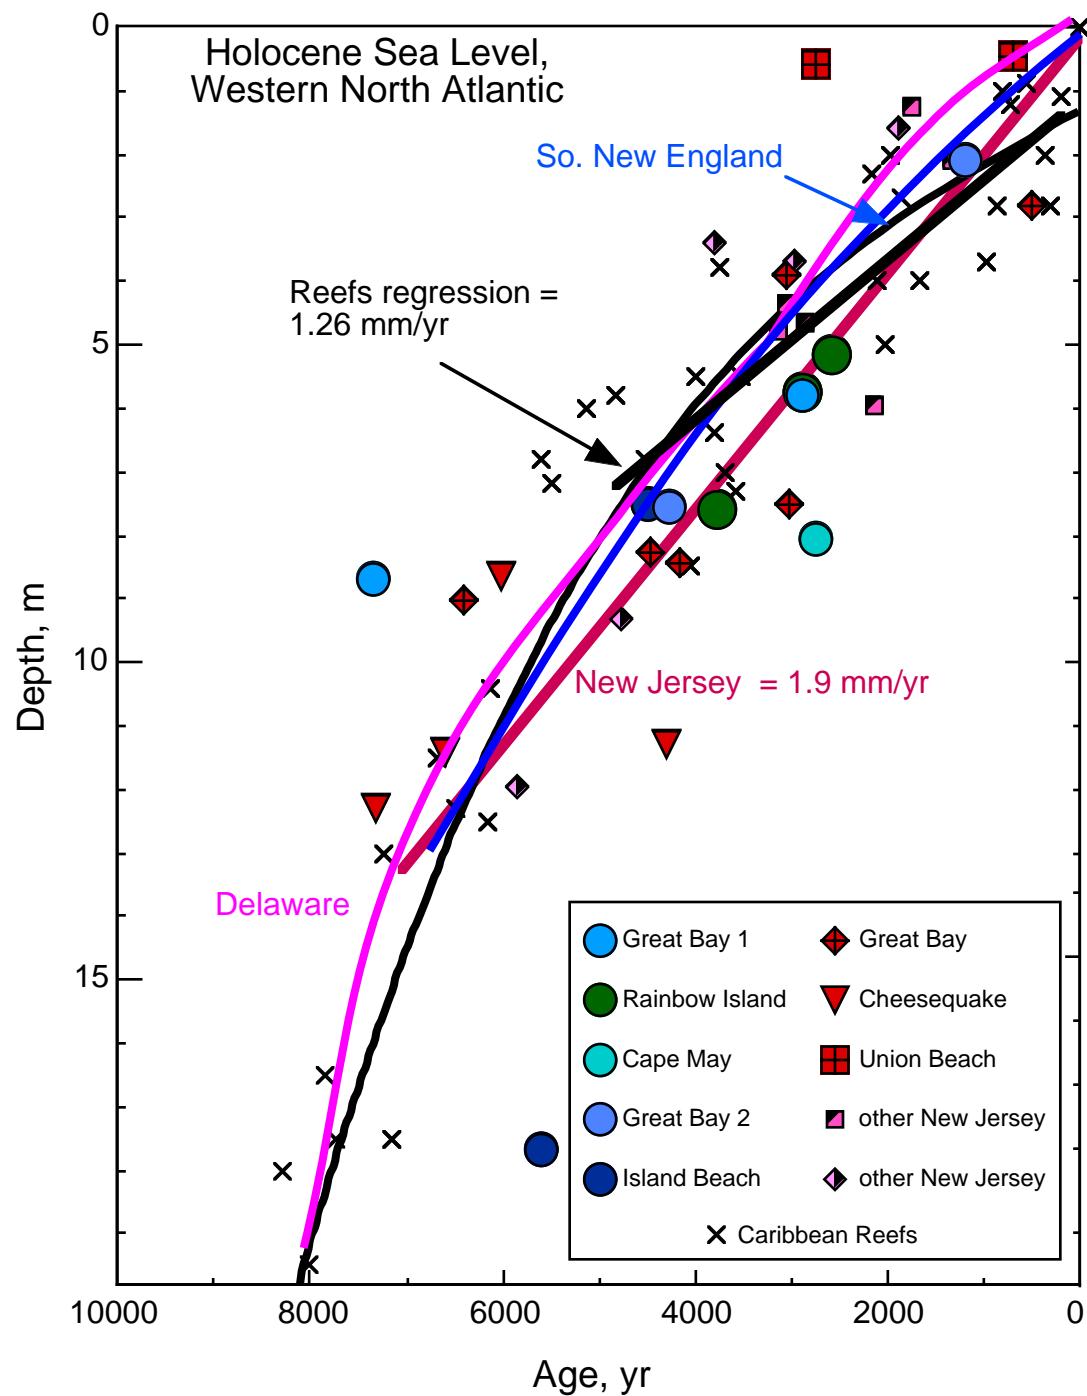

Fig. S3. Comparison of the sea-level estimate and  $\delta^{18}\text{O}$  record from Figure 3 with the sea-level record of Haq (11), the long-term record of Watts (14) from backstripping of the Scotian shelf and New Jersey outer continental shelf, and the backstripped record of Sahagian (35) from the Russian platform and Siberia. Note that the scale for the Haq estimates (green axis) is 2 times that of our sea-level estimate (blue line and axis). Watts and Sahagian curves are plotted using the blue axis.

Fig. S4. Spectral content of the sea-level curve. The sea-level curve is shown at the top in black, with a 0.1 my Gaussian interpolation that was used for spectral analysis shown in red. To the right is the periodogram of the data in black with the expected red noise spectrum in red. The image shows variation in spectral power through time calculated using the Gaussian Wigner Transform implemented by Igor Pro™. Spectral power is indexed to colors according to the scale in the upper right. Note that the vertical period and frequency axis are log<sub>2</sub> scales, but with tick marks at linear intervals.

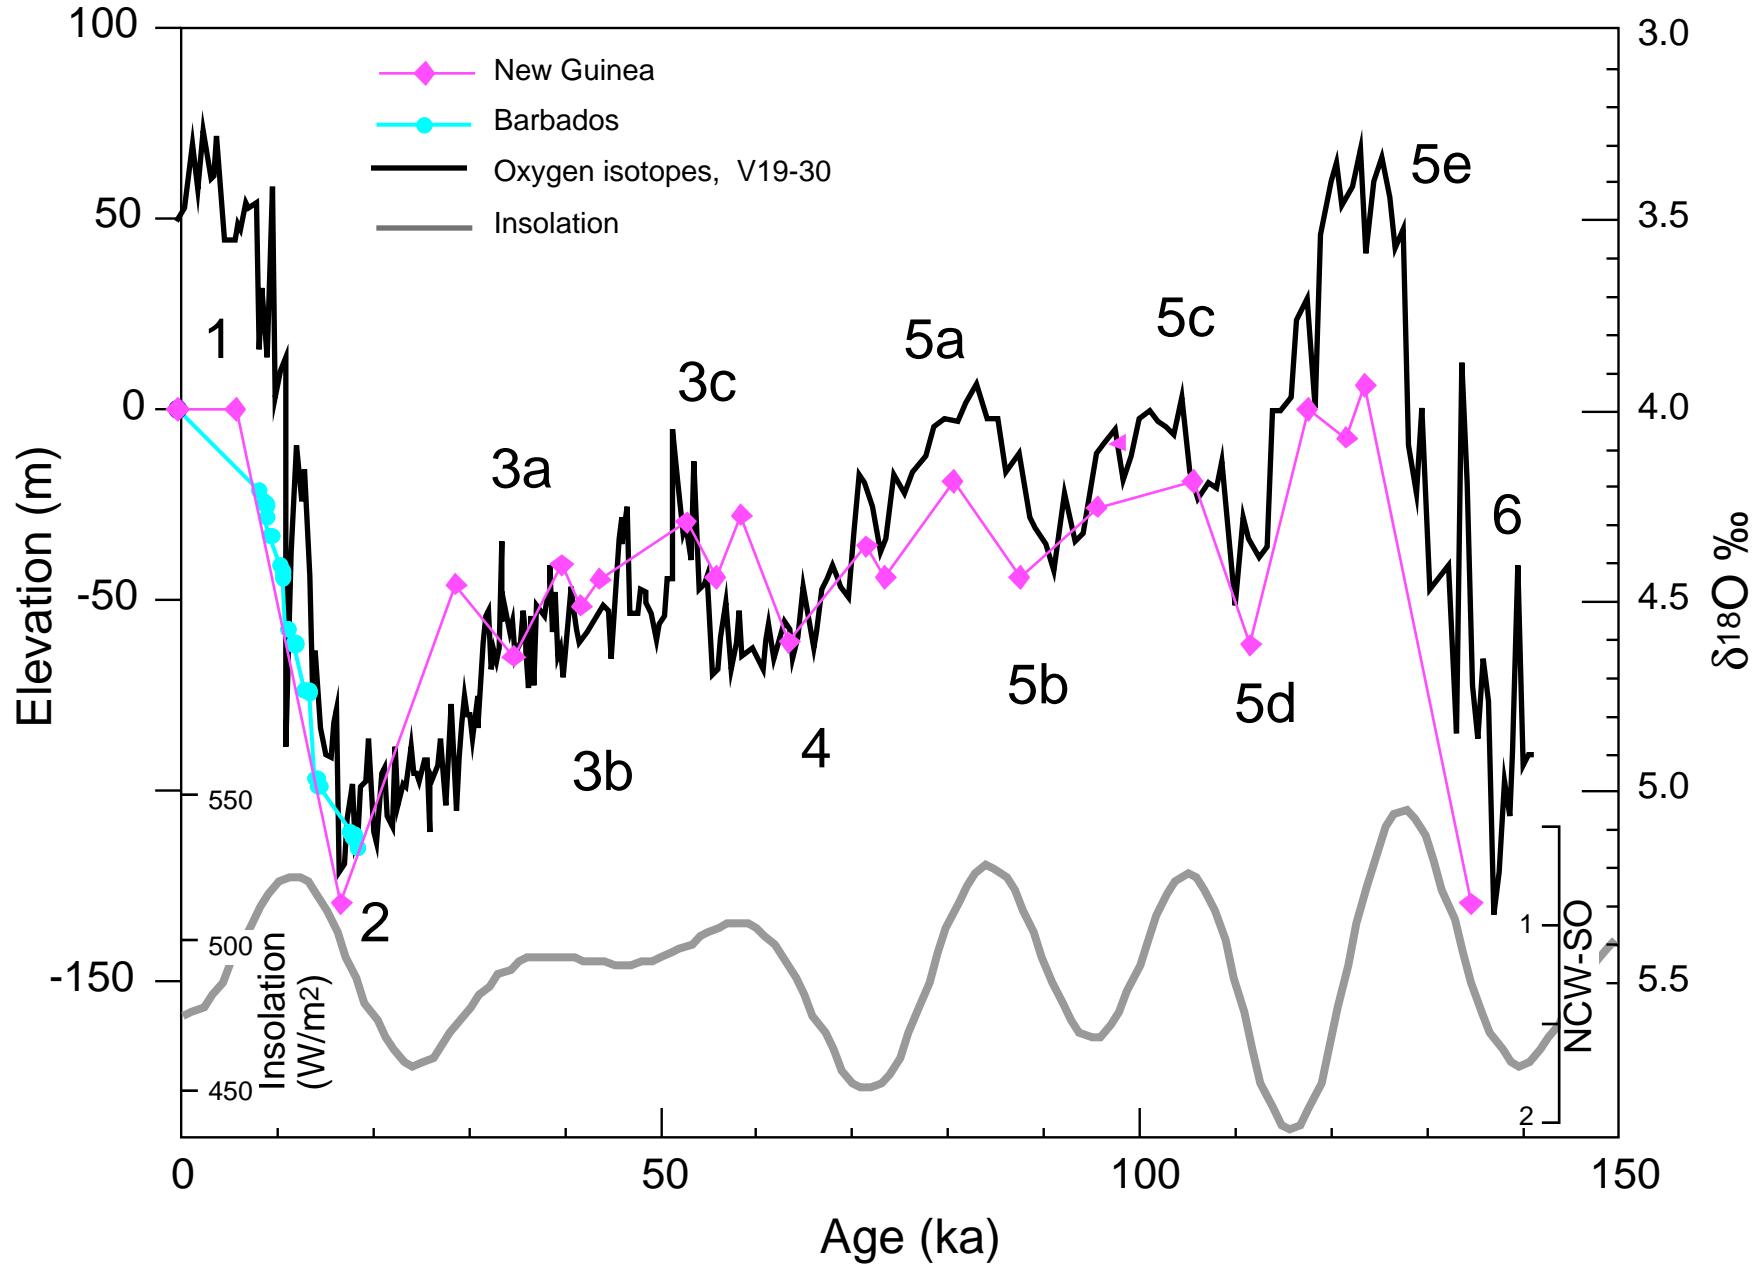

Fig. S5. Benthic foraminiferal  $\delta^{18}\text{O}$  data (13) from Ocean Drilling Program Site 904 (NJ continental slope) plotted versus depth showing magnetic chronozone, core photographs, reflectivity, and core log impedance. Also shown are  $\delta^{18}\text{O}$  records from South Atlantic Site 929 (53) that allow correlation to the Site 904 record. Red curve is plotted versus depth while the black is plotted versus age scale.
